# EXPERIMENT 11

# Application Deployment and Migration

## Insurance Claim Request & Processing Management – Zoho Creator

### 1. Aim

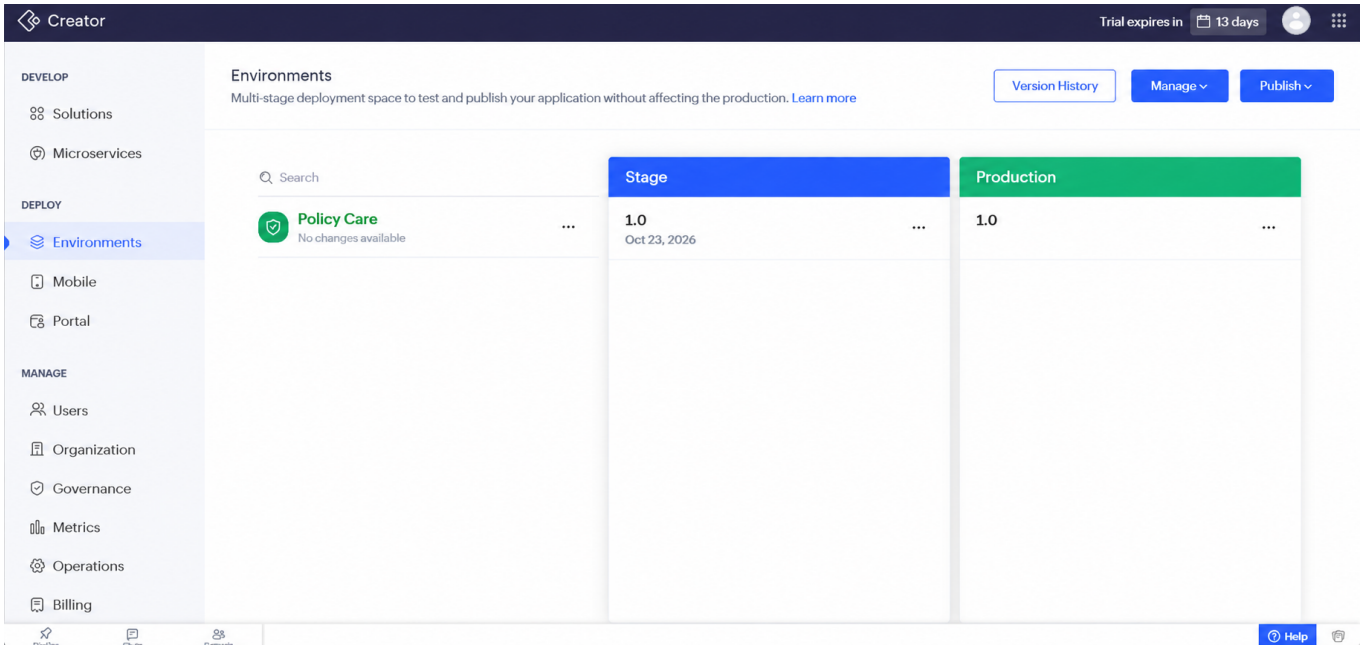

To understand the deployment of a Zoho Creator application by reviewing its Stage and Production environments and identifying how an application version can be managed and published.

### 2. Procedure

1. Sign in to Zoho Creator and open the Policy Care application workspace.
2. From the left navigation panel, select Environments under the Deploy section.
3. Locate the Policy Care application and review the environments displayed on the page.
4. Observe the Stage environment, which is used to test and validate application changes before they are released to production.
5. Observe the Production environment, which represents the published version intended for regular use.
6. Compare the version numbers shown in Stage and Production and note the displayed version and date information.
7. Review the Version History option to understand where earlier application versions can be viewed.
8. Inspect the Manage and Publish menus to identify the available deployment-management actions.
9. Before publishing changes, verify the application in the Stage environment to reduce the risk of affecting the live application.
10. Capture a screenshot of the Environments page showing the Stage and Production versions as evidence of the deployment setup.

### 3. Screenshots

Screenshot 1 – Zoho Creator Environments page showing the Policy Care application, Stage and Production environments, version information, and deployment controls.

## 4. Result

The Environments page of Zoho Creator was reviewed. The Policy Care application displayed separate Stage and Production environments, both showing version 1.0. The Version History, Manage, and Publish controls were also visible, demonstrating the environment-based application deployment interface.
