EXP 13: CASE STUDY ON LOW-CODE LIMITATIONS

Aim

To study the limitations of low-code development platforms using Zoho Creator and understand the challenges involved in developing, customizing, maintaining, and optimizing the Policy Care insurance claim management application.

Procedure

1. Introduction to the Low-Code Platform: Open Zoho Creator and study its drag-and-drop development environment, including forms, reports, workflows, and application settings.

2. Application Development: Examine the Policy Care application used to manage insurance claims. The Claim Request Form collects claimant details, policy number, contact information, claim type, incident date, claim amount, insurance company, supporting documents, and incident description.

3. Form Customization: Configure form fields according to the insurance claim process. Identify cases where advanced validation, conditional logic, or specialized interactions may require additional configuration or Deluge scripting.

4. Report Creation and Data Management: Examine reports such as All Requests, ALL CLAIM LIST, CLAIM SPREADSHEET, and Claim Status Kanban. Consider how filters, field visibility, and large numbers of records can affect report usability.

5. Workflow Configuration: Study actions triggered when forms are submitted or records are updated. Identify challenges involving complex conditions, repeated database searches, calculations, and interactions between forms and reports.

6. User Management: Examine how users are added and how application access is shared. Understand that users may need to be added to the account before the application can be shared with them.

7. Role-Based Access Control: Examine the CEO, Claims Officer, and Surveyor roles. The CEO manages the application, the Claims Officer can manage claims, and the Surveyor has read-only access, according to the configured permissions.

8. Performance Optimization: Review forms, reports, and workflows for potential inefficiencies such as unnecessary workflow executions, repeated data retrieval, excessive displayed fields, and inefficient scripts.

9. Customization Limitations: Study how predefined components may not support every specialized requirement and how advanced functionality may need custom scripting or workarounds.

10. Platform Dependency: Understand that the application depends on Zoho Creator's features, scripting language, data storage, permissions, and subscription plan. Moving to another platform may require redesigning components.

11. Testing and Troubleshooting: Submit sample claim information and check the expected reports. If a record is missing, investigate report criteria, permissions, form configuration, and workflow behavior.

12. Analysis of Limitations: Compare the ease of building standard features with the effort needed for advanced customization, performance tuning, and access control. Recommend planning, testing, and

optimization.

Result

The case study identified potential limitations of low-code platforms, including restricted customization, complex workflow development, and performance optimization. Proper planning, testing, and scripting can help address these challenges and improve application efficiency.
