EXPERIMENT 10: PERFORMANCE OPTIMIZATION IN ZOHO CREATOR

AIM

To optimize the performance of the Policy Care application in Zoho Creator by reviewing and improving workflow execution, reducing unnecessary processing, and ensuring that form actions are executed efficiently.

PROCEDURE

1. Open the Policy Care application in Zoho Creator.

2. Open the Claim Request Form and navigate to its workflow settings.

3. Select the successful form submission workflow named *Document Reminder*.

4. Review the Deluge script used to identify missing claim documents and prepare a reminder email.

5. Inspect the script logic to understand how records are fetched, required documents are checked, and reminders are sent only when documents are missing.

6. Review the workflow for opportunities to avoid unnecessary record processing and email actions.

7. Use the Update option only after verifying any intended changes. In this experiment, the supplied screenshots document the existing workflow and script; they do not show a completed optimization change.

SCREENSHOTS

Figure 10.1: Document Reminder workflow configured for successful Claim Request Form submission.

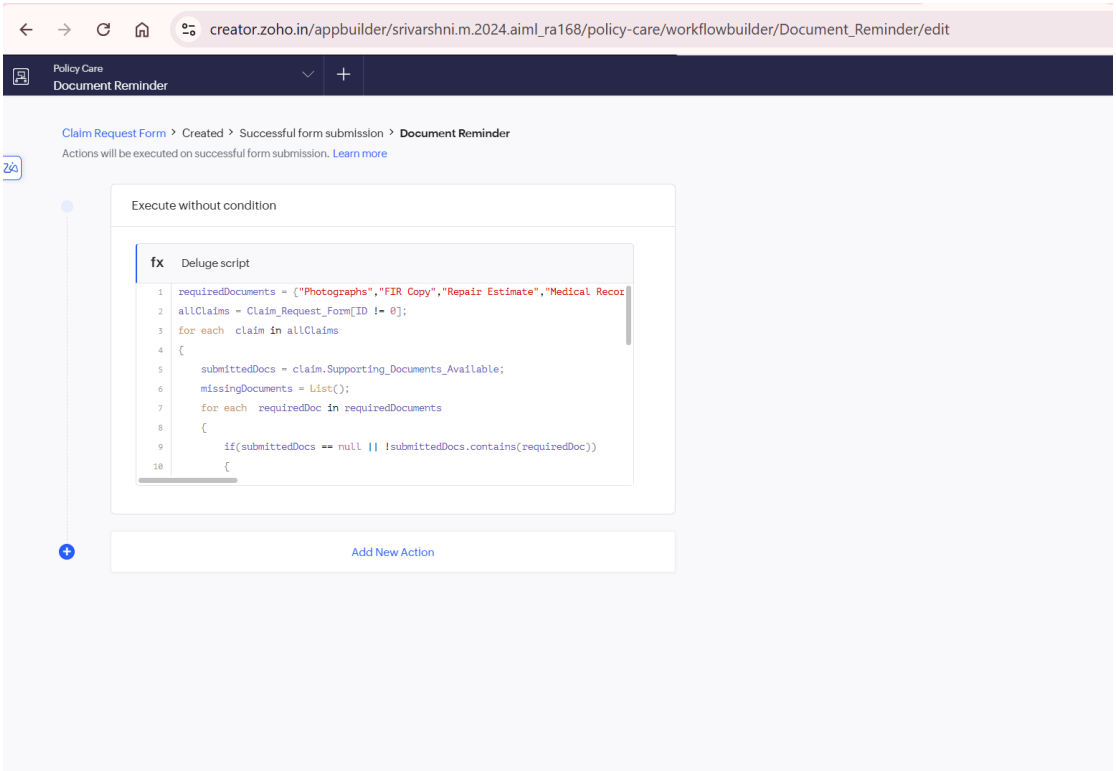

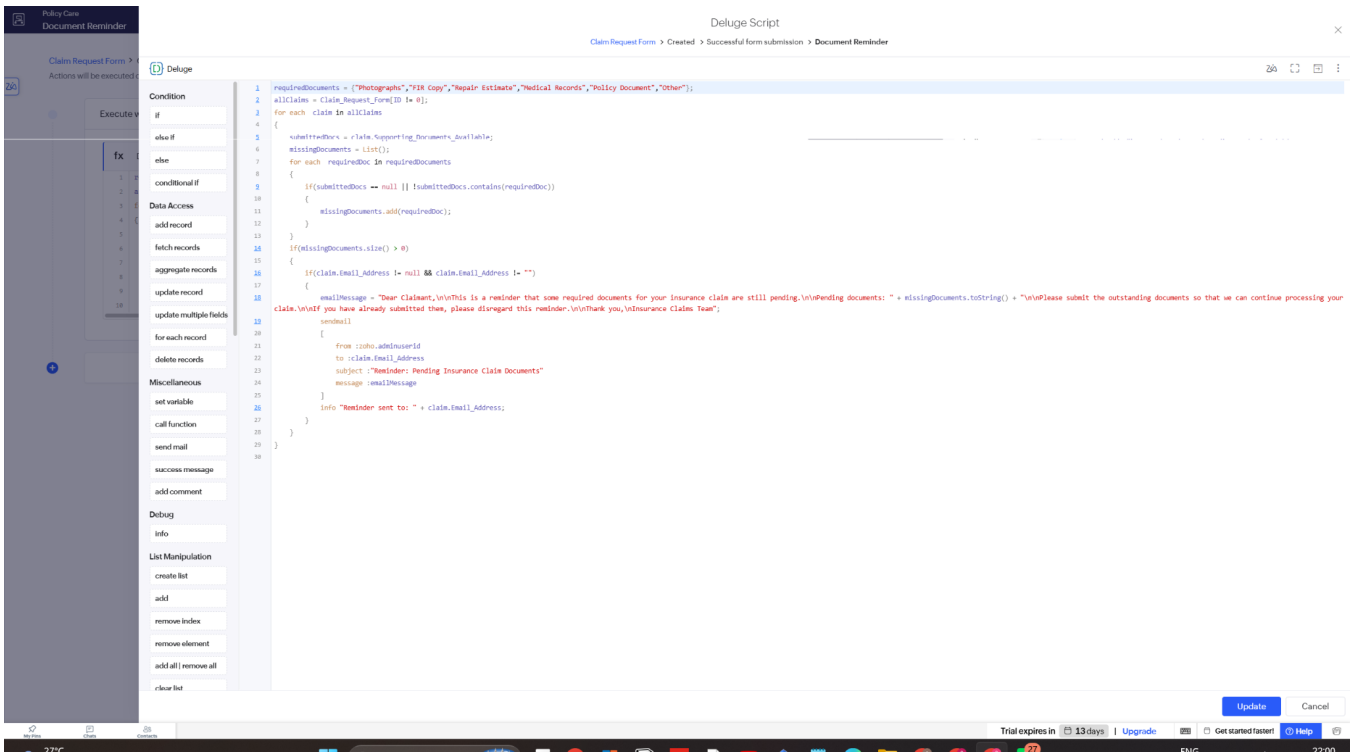

Figure 10.2: Deluge script for checking required documents and preparing reminder emails.

RESULT

The Document Reminder workflow and its Deluge script were reviewed in Zoho Creator. The script checks whether required documents are missing and prepares a reminder email for the claimant. The screenshots document the existing workflow logic. A measurable performance improvement is not confirmed by the supplied screenshots.
