EXPERIMENT 12

SECURITY AND GOVERNANCE IN ZOHO CREATOR

AIM

To study security and governance features in Zoho Creator by reviewing organization sign-in activity, administrative audit logs, and the application Audit Trail for tracking record-level changes.

PROCEDURE

1. Sign in to Zoho Directory using an authorized administrator account.

2. Open the Dashboard and review the sign-in summary, including successful and failed sign-ins, unique users, and recent sign-in activity.

3. Open **Audit** → **Audit Logs** in Zoho Directory. Review the date, activity, actor, target, and module columns.

4. Open Zoho Creator and select the **Policy Care** application.

5. Navigate to **Operations** → **Audit Trail** and select **Claim Request Form**.

6. Review the audit entries for actions such as added, edited, or deleted records. Use the available filters—date, user type, action, record ID, source, and email address—to narrow the results.

7. Verify that the audit trail identifies the action, user, time, and record ID. These details help with accountability and troubleshooting.

SCREENSHOTS AND OBSERVATIONS

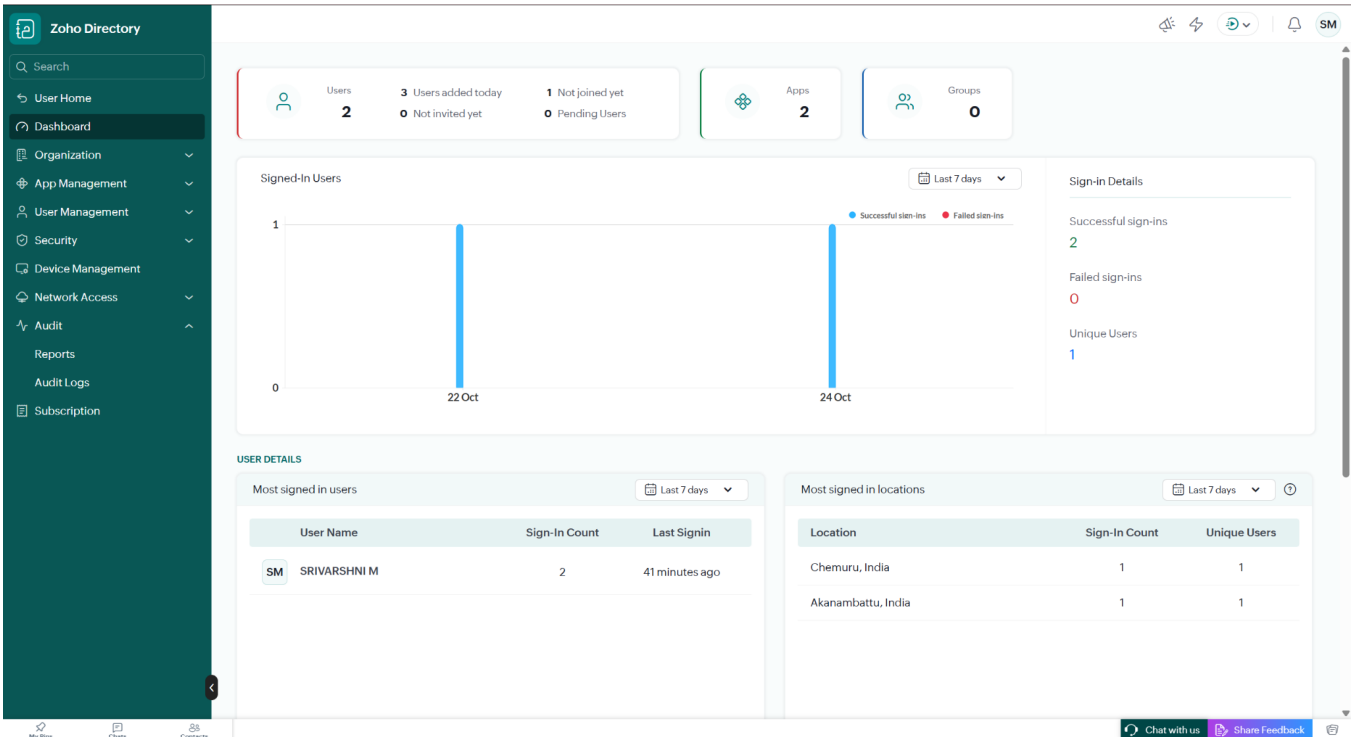

Figure 1. Zoho Directory Dashboard showing user and sign-in activity metrics.

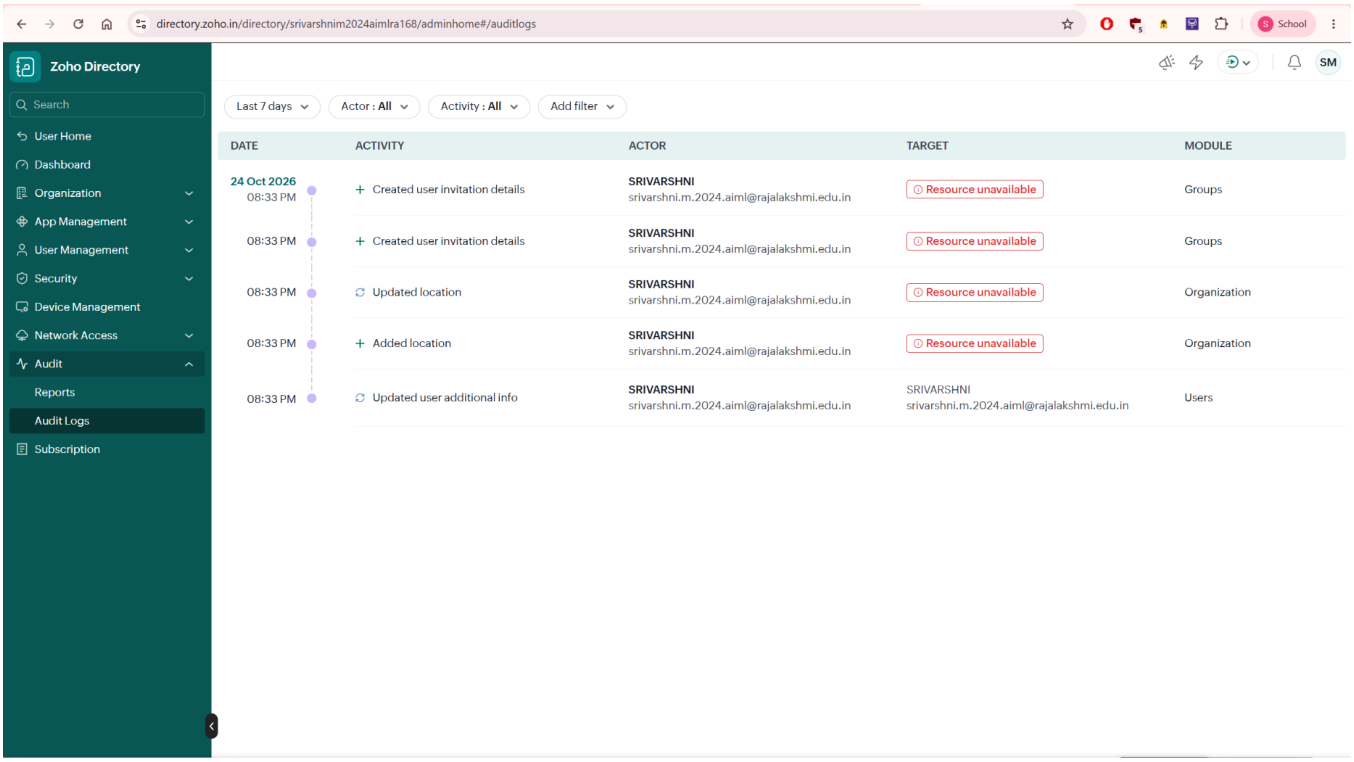

Figure 2. Zoho Directory Audit Logs showing administrative activities, actors, targets, and modules.

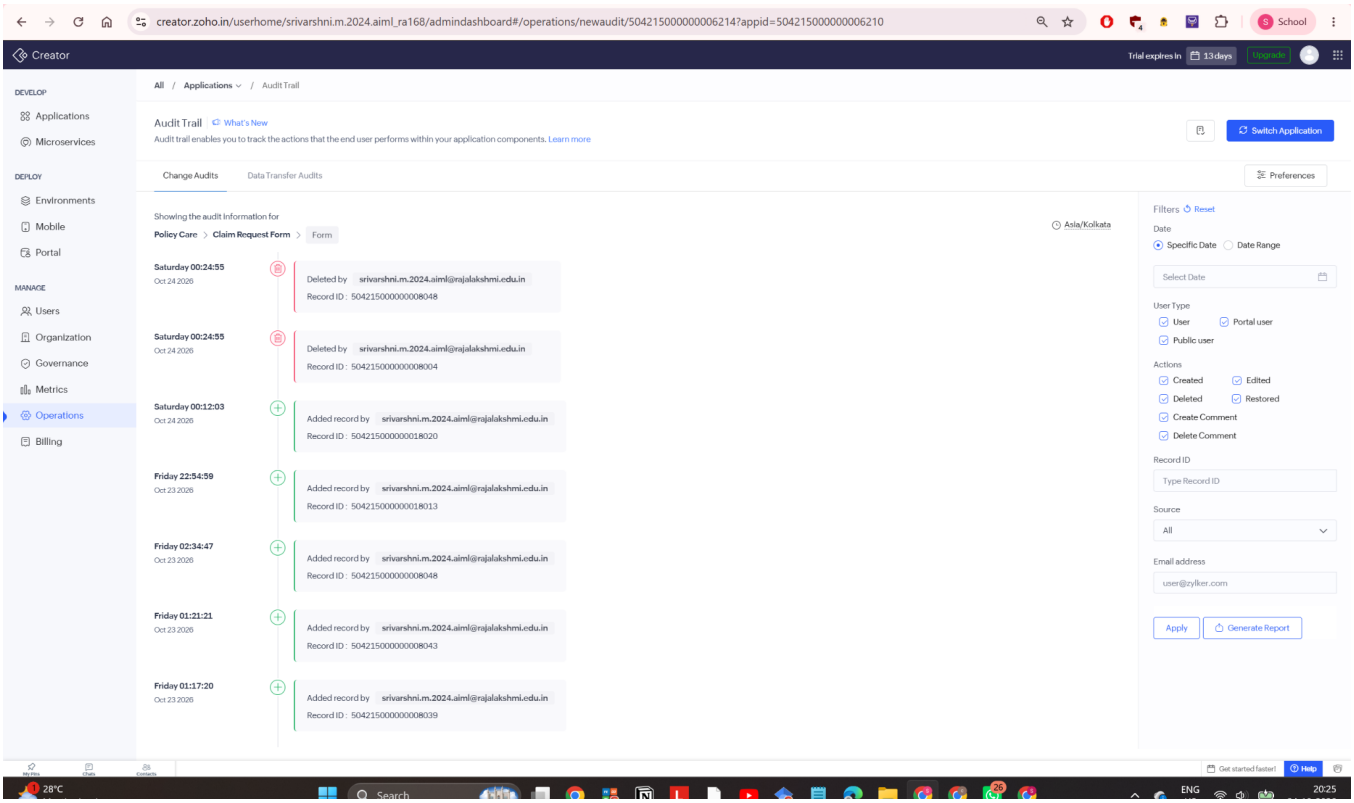

Figure 3. Zoho Creator Audit Trail for Claim Request Form, showing added and deleted record events.

RESULT

The security and governance features of Zoho Directory and Zoho Creator were reviewed. The Directory Dashboard summarized sign-in activity, the Directory Audit Logs displayed administrative events, and the Zoho Creator Audit Trail showed record-level events for Claim Request Form. These logs support monitoring, traceability, accountability, and auditing.
